

Technical Presentation

Topic: Operational Systems vs DSS

Introduction

Operational Systems and Decision Support Systems (DSS) are two important types of information systems used in organizations.

Operational System (OLTP): Handles day-to-day business transactions such as sales, banking, and ticket booking.

Decision Support System (DSS/OLAP): Helps managers and executives analyze data to make strategic business decisions.

OLTP vs OLAP Concepts

OLTP (Online Transaction Processing)

Used for daily business operations.

Processes a large number of transactions quickly.

Data is updated continuously.

Example: ATM transactions, online shopping, railway reservation.

OLAP (Online Analytical Processing)

Used for data analysis and reporting.

Supports complex queries on historical data.

Helps in decision-making and business planning.

Example: Sales analysis, profit analysis, market trend analysis.
